

Test Case Analysis Report

Overview

The ParaBank Automation Framework was executed to validate the core banking functionalities of the application. Automated test cases were developed using Selenium WebDriver, Java, TestNG, Maven, and Jenkins.

Test Execution Summary

Metric	Count
Total Test Cases	18
Executed Test Cases	18
Passed Test Cases	14
Failed Test Cases	4
Blocked Test Cases	0

Module-wise Analysis

Module	Status
Registration	Passed
Login	Passed
Open Account	Passed
Account Overview	Passed
Transfer Funds	Passed with Defects Identified
Bill Pay	Passed with Defects Identified

Defect Analysis

Bug ID	Description	Severity
BUG-1	Same Account Transfer Allowed	Medium
BUG-2	Zero Amount Transfer Allowed	Medium
BUG-3	Zero Amount Bill Payment Allowed	Medium
BUG-4	Negative Amount Bill Payment Allowed	High

Test Coverage

- User Registration
- User Login
- Open New Account
- Account Overview
- Fund Transfer
- Bill Payment
- Cross Browser Execution (Chrome and Firefox)

Challenges Faced

- Browser compatibility configuration.
- Jenkins pipeline setup.
- Selenium WebDriver version compatibility.
- Dynamic test data management for user registration.

Conclusion

The automation framework successfully validated the major functionalities of the ParaBank application. Most test cases executed successfully, while four defects were identified during negative testing. The framework supports automated execution through Jenkins and generates execution reports using Extent Reports.

Project Summary

The ParaBank Automation Framework was developed using Selenium WebDriver, Java, TestNG, Maven, Jenkins, and GitHub following the Page Object Model (POM) design pattern. The framework automates key banking functionalities including User Registration, Login, Account Management, Fund Transfer, and Bill Payment.

A total of 18 automated test cases were executed. Out of these, 14 test cases passed successfully and 4 defects were identified during negative testing. The defects were documented and tracked using Jira. Jenkins was integrated for automated test execution, and Extent Reports were generated to provide detailed execution results.

The framework supports cross-browser testing on Chrome and Firefox and helps reduce manual testing effort through automation and reusable test components.
